This invention relates to a cancer cell specific HLA-F antigen. The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                        Novel cancer cell-specific HLA-F antigen useful for diagnosing cancer.
                                                                                                       Human cancer cell specific HLA-F antigen SEQ ID 5.
                                                                                                                                HLA-F antigen; cancer cell specific; human.

```
The present invention relates to an agent for preventing or treating cancer. The agent comprises a portion or a complete sequence of a human leukocyte antigen (HLA)-F DNA. Also disclosed is a cell capable of presenting a cancer-cell specific antigen transformed with HLA-F DNA, or a plasmid or viral vector comprising HLA-F DNA, a cytotoxic T lymphocyte (CTL) inducer which induces CTL which is non-specific to an organ, is unrestricted to the major histocompatibility complex (MHC) and specific to a cancer cell, and an anti-HLA-F antibody. The agent of the invention is useful for treating or preventing cancer. A cell capable of presenting a cancer-cell specific antigen is useful for measuring HLA-F antigen and for diagnosing cancer. The present sequence represents part of the human cancer-cell specific HLA-F antigen.
                                                                                                                                                                                                                                          240

The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the

The methods of the invention are useful for detecting an ovarian tumour in a patient, for identifying an individual at increased risk for developing ovarian cancer, in prognostic tests for assessing the relative severity of ovarian cancer, in tests for monitoring a patient in remission from ovarian cancer and in tests for monitoring disease status in a patient being treated for ovarian cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting and identifying ovarian tumor, identifying increased risk for developing ovarian cancer, and determining effectiveness of ovarian cancer treatment, by measuring expression level of ovarian tumor marker

The methods can additionally be used to identify a particular tumour as being an ovarian tumour (i.e., an epithelial ovarian tumour selected from serous cystadenoma, borderline serous tumour, muchous cystadenoma, borderline serous tumour, muchous cystadenoma, borderline serous tumour, muchous cystadenocarcinoma, endometrioid carcinoma, undifferentiated carcinoma, clear cell adenocarcinoma, endometrioid carcinoma, adenofibroma and Brenner tumour. The ovarian tumour marker genes of the invention were identified using SAGE (serial analysis of gene expression) and were found to be using SAGE (serial analysis of gene expression) and were found to be using sAGE (serial analysis of gene expression) and were found to be relative to normal ovarian epithelial cells. The marker genes are implicated in immune response pathways, in the regulation of cell progliferation and in protein folding, and many of these are membrane corliferation and in protein folding, and many of these are membrane. Inclined or secreted. In addition to their use as diagnostic and prognostic markers, the ovarian tumour marker genes or their encoded prevention of ovarian cancer. Sequences ABBSOSS7-ABBSOS99 represent proteins encoded by ovarian tumour marker genes of the invention

```
The present invention relates to an agent for preventing or treating cancer. The agent comprises a portion or a complete sequence of a human leukocyte antigen (HLA)-F DNA. Also disclosed is a cell capable of presenting a cancer-cell specific antigen transformed with HLA-F DNA, or a plasmid or viral vector comprising HLA-F DNA, a cytotoxic T lymphocyte (CTL) inducer which induces CTL which is non-specific to an organ, is unrestricted to the major histocompatibility complex (MHC) and specific to a cancer cell, and an anti-HLA-F antibody. The agent of the invention is useful for treating or preventing cancer. A cell capable of presenting a cancer-cell specific antigen is useful for measuring HLA-F antigen and for diagnosing cancer. The present sequence represents human cancer-cell specific antigen.

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises or chronic obstructive pulmonary disease. The method comprises or chronic obstructive pulmonary disease. The marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy subject, and judging whether the subject has bronchial asthma or chronic obstructive pulmonary disease. The marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial cells are stimulated with interleukin-13; or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13. Also described: (1) a reagent (1) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (3) an animal model for bronchial asthma or chronic obstructive pulmonary disease; (5) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease; (6) a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease, comprising the compound, a marker gene or an antisense nucleic acid corresponding to a portion of the marker gene, a ribozyme, a polymucleotide that suppresses the expression of the gene through an RNAi effect or an antibody recognising a protein encoded by a marker gene; and (7) a DNA chip for testing for a proceding asthma or a chronic obstructive pulmonary disease, on which a proceding activities, and can be used in gene therapy. The method is useful for testing for or screening for a therapeutic agent invention.

Expense of the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            121 KDYISLNEDLRSWTAADTVAQITQRFYEABEYAEEFRTYLEGECLELLRRYLENGKETLQ 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic slet, lung, bone marrow or stem cell transplant rejection, method is also useful in assessing the immune status of an individual. The methods are also useful in assessing the immune status of diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammancory bowel diseases, multiple solebroais, HTV/AIDS or viral, bacterial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EWITGYAKANAQTDRVALRNILRRYNQSEAGSHILQGMNGCDMGPDGRLLRGYHQHAYDG 120

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's hereditary optic neuropathy (LHON), mitochondrial concephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypepide sequence is a human heart mitochondrial protein of the invention.
                                                                                                                                                                                                                                                                  Huntington's disease; osteoarthritis;
Leber's hereditary optic neuropathy; LHON;
mitochondrial encephalopathy lactic acidosis and stroke; MELAS;
myoclonic epilepsy ragged red fibre syndrome; MERRF; cancer;
neuroprotective; nootropic; antidiabetic; anticonvulsant; antiarthritic;

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic

                   AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB4338 to AAB44239. The proteins can have activities based on the tissues and calls the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiaethmatic; antirheumatic; antidiator; antivities antibactor; antibactor; antibactor; antibactor; cagulant; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipactiatic and antiangingenic. The polymucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polymucleotides, polypeptides, antibodies, agonists and antagoniets from the proliferation, differantiation or mobilisation of inhibiting the proliferation, differantiation or mobilisation of inflammation, cancers cardiovascular disorders, neurological disease and organ rejection, modulate haemostatic or thrombolytic activity, modulate inflammation, cancers cardiovascular disorders, neurological disease and papenserial or viral limeterinas. The peptides, nucleotides, antibodies, agonists and antagonists may be also be used in drug screens. AAC78457 and AAB44240 represent sequences used in the exemplification of

The invention includes DNA encoding the antigen, and a method for the preparation of the cancer cell specific HLA-F antigen. The antigen may be used in a method to diagnose cancer, in which the protein is used to detect anti-HLA-F antibodies in bodily fluids of the patient. The present sequence represents the cancer cell-specific HLA-F antigen of the

The present invention relates to an agent for preventing or treating cancer. The agent comprises a portion or a complete sequence of a human leukocyte antigen (HiA-F DNA. Also disclosed is a cell capable of presenting a cancer-cell specific antigen transformed with HiA-F DNA, or a plasmid or viral vector comprising HiA-F DNA, a cytotoxic T lymphocyte (CTL) inducer which induces CTL which is non-specific to an organ, is unrestricted to the major histocompatibility complex (MHC) and specific to a cancer cell, and an anti-HiA-F antibody. The agent of the invention is useful for treating or preventing cancer. A cell capable of presenting a cancer-cell specific antigen is useful for measuring HiA-F antigen and for diagnosing cancer. The present sequence represents part of the human cancer-cell specific HiA-F antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 RRYNOSBAGSHTLOGMNGCDMGPDGRLLRGYHQHAYDGKDYISLNBDLRSWTAADTVAQI 120

The present sequence is a polypeptide encoded by one of a large number of program defined from RNMs encoding secreted proteins. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (URR) of the mRNA because they are often obtained from oligo-draprimed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where included. S' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, game therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian

The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to cDNAs encoding them (ABP4131-ABP56305), and also encompasses polypeptides 90% identical and polymotechides 93% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens to polymotechides, antibodies against human ovarian antigens and the use of ovarian antigen polymotechides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Buch conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system of sorders (e.g., infertility, disorders of pregnancy, anovulation.) polycystic ovary syndrome, ovarian orpsets, and dysmenorines of polycystic ovary syndrome, ovarian orpsets, and dysmenorines, infertions (e.g., chiamydia, HIV, toxoplasmosis, and toxic shock syndrome, organities, systemic lupus erythematosus), blood-related disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oobhorities, systemic lupus erythematosus), blood-related disorders. (e.g., anaemia), cardiovascular disorders, nucrological disorders, gastrointestinal disorders and urinary system disorders. Ovarian antigen polypeptides and polypeptides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polymucleotides may be used for gene therapy, chromosome mapping, in the present squence represents a human ovarian antigen of the prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the propertices are the propertices.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              66 YAKANAQTDRVALRNILLRRYNQSEAGSHTLQGMNGCDMGPDGRLLRGYHQHAYDGKDYIS 125

The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6808 amino acid sequences ("Illy defined in the specification. The probe is a single exon probe that bybridises under high stringency conditions to a nucleic acid molecule expression (comprising a plurality of single exon mucleic acid molecule expression (comprising a plurality of single exon nucleic acid adressably isolatable or amplifiable from the plurality), a single and addressably isolatable or amplifiable from the plurality), a single contiguous amino acids of any of the above. mentioned amino acid exon probes contiguous amino acids of any of the above. mentioned amino acid sopposition and addression acids of any of the above. mentioned amino acid soppositionally with conservative amino acid substitutions), and sequences (optionally with conservative amino acid substitutions), and econtiguous amino acids of any of the above. mentioned amino acid substitutions), and accomplisated antibody that binds specifically to a peptide cited above.

Contiguous amino acids of any of the above mentioned amino acid substitutions), and accomplisated antibody that binds specifically to a peptide cited above. The probes may be used as tools for surveying a customer desiring to measure gene expression, and accompleter-readable cited above. The probes may be used as tools for surveying to expression analysis. The probes may be used as tools for surveying to expression analysis. The probes may be used as tools for surveying to expect the probes may be used as tools for surveying alternative splicing events, in detecting and characterising according and contains a detabase having a plurality of according to expression and acterious, in priming the synchologome, the probes are used in identifying and characterising and alternative splicing events, in detecting and characterisin
                                                                                                                                                                               New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       183 DPPKAHVAHHPISDHEATLRCWALGFYPAEITLTWQRDGEEQTQDTELVETRPAGDGTFQ 242

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
